

Your Pre-Sleep Ritual Workbook

Deepak, this is your nightly homework from Session 2. Six steps, 30 minutes, same time every night. The consistency is what drives the results. Do the full ritual every night starting tonight. Even partial practice helps — but the complete sequence is where the real changes happen.

THE 6-STEP PRE-SLEEP RITUAL

1 Processing Journaling (Wishful Thinking Stage)

10:00 PM

Open your journal. Write down everything on your mind — the day's events, unfinished thoughts, things still processing. This is the Wishful Thinking Stage: your brain is replaying and rehearsing. Get it out of your head and onto paper. Do not filter. Do not organize. Just dump.

Why this works: Your subconscious processes data during sleep. When you write it down first, you give it a head start — the processing happens on paper instead of at 2 AM.

2 Precognitive Journaling

10:10 PM

Write what is planned for tomorrow. Meetings, tasks, decisions, errands. Your subconscious needs to know the conscious mind has a plan. Once it sees the plan on paper, it stops running scenarios in your sleep.

Why this works: The Precognitive stage of sleep is when your brain models the future. If you've already done that on paper, your brain doesn't need to run those simulations at the expense of deep sleep.

3 Venting with Plan for Next Day and Future

10:15 PM

Write anything still bothering you — frustrations, worries, unresolved feelings. Then write the plan for how you will handle them. Close the loop. If there is no solution yet, write "I will address this on [specific day]." That is enough for your subconscious to let go.

Why this works: The Venting stage of sleep clears emotional backlog. Writing it down first means your brain doesn't need to vent at 3 AM with racing thoughts.

4 Close the Journal

10:20 PM

Physically shut the journal. Put the pen down. This is a ritual closure — the act of closing signals your subconscious: **processing is done. The queue is clear. Nothing more to think about tonight.**

Why this works: Physical actions anchor mental states. Closing the journal is like closing all the tabs on a browser — the system can finally rest.

- Get into bed. Then:
- **Tension-release (15 seconds):** Make two fists, squeeze hard for 5 seconds, release. Shoulders to ears, squeeze 5 seconds, release. Scrunch your face, squeeze 5 seconds, release. Feel the flood of relaxation.
 - **4-7-8 Breathing (3 cycles):** Tongue on the ridge behind your upper teeth. Breathe in through your nose for 4 counts. Hold for 7 counts. Exhale through your mouth for 8 counts. Three cycles total.
 - **Progressive relaxation:** Scan from head to toes. Each body part gets heavier. Head heavy. Shoulders heavy. Arms heavy. Chest drops. Legs heavy. Feet warm.

Why this works: For a Physical suggestible like you, muscular signals trigger sleep onset more effectively than mental techniques alone. The tension-release gives your body a clear "before and after" contrast.

Close your eyes. Picture the Island Cabin: the bed, the weighted blanket, the ceiling fan turning slowly, the sound of ocean waves. Say silently to yourself:

"Heavy. Restored. Calibrated. Delta Lock."

The Pillow Trigger activates. The Depth Dial turns to DELTA LOCK. Let the settling pond clear. Four breaths to sleep.

Why this works: The suggestions installed during Session 2 are anchored to these cues. Repeating them nightly reinforces the programming. Each night, the response gets faster and deeper.

IF YOU WAKE DURING THE NIGHT

- Do not** check the phone. **Do not** look at the clock. **Do not** think about anything.
- Do this:** Place your hand on your chest. Take one 4-7-8 breath. On the exhale, the Depth Dial resets to DELTA LOCK. Back to delta within 60 seconds.
- If that is not enough:** Picture the miniature golf course. See the first hole. Line up the putt. Swing. The ball rolls. Hole in one. Second hole — through the clown's mouth. Third hole — the little bridge over water. Play each hole in your mind. Most people are asleep by hole five.

WEEKLY TRACKING (EVERY 3-4 DAYS)

Check in with yourself every 3-4 days. How you *feel* matters more than what the app says.

WHAT TO TRACK	BASELINE (SESSION 1)	THIS WEEK	NOTES
How I feel waking up (1-10)	4/10 (exhausted)		
Falling asleep	Difficult (~35 min)		
Night-waking	Frequent, hard to return		
Daytime energy	Low, persistent fatigue		
Ritual compliance	Starting		

DREAM JOURNAL

If you wake remembering a vivid dream, write 2-3 words. Vivid dreams = the system clearing backlog = proof the hypnosis is working. If no dreams, write "none." Both are data.

Day 1	Day 2	Day 3	Day 4	Day 5	Day 6	Day 7
-------	-------	-------	-------	-------	-------	-------

SESSION RECORDING

You will receive an audio recording of the therapy portion of today's session (the relaxation and installation sections). Listen to it **at least once before Session 3**, ideally in bed before sleep.

Safety: Never listen while driving or operating machinery. Listen only in a safe, comfortable place where you can relax fully. Do not share this recording — the suggestions are personalized for your suggestibility profile.

QUICK REFERENCE CARD

TRIGGER	WHAT HAPPENS
Head on pillow + 4-7-8	Depth Dial auto-locks to DELTA. Four breaths to sleep.
Hand on chest + one 4-7-8	Night-waking reset. Back to delta in 60 seconds.
10:30 PM	Nervous system begins shutdown sequence automatically.
Vivid dream recalled	System clearing backlog. Proof hypnosis is working.
Tracker shows improvement	Positive feedback loop. Each check reinforces deeper sleep.
"Heavy. Restored. Calibrated. Delta Lock."	Self-hypnosis cue. Island Cabin + Depth Dial activation.

NEXT SESSION

Session 3 is scheduled 1-2 weeks after today. We will review your tracking data, dream journal, and ritual compliance. Session 3 focuses on **maintenance + overactive mind** — addressing mid-sleep waking and cognitive quieting.

Schedule at: calendly.com/jeeth-vrishihypno/90min

Questions between sessions? Message via PocketSuite or email jeeth@vrishihypno.com.

Important: If sleep deteriorates significantly, you experience persistent anxiety, panic, or suicidal thoughts, or develop new physical symptoms — contact your primary care physician immediately. Hypnotherapy is for vocational/avocational self-improvement (CA B&P §2908) and is not a substitute for medical treatment.
