ISSUES ADDRESSED

Presenting concern: "I am struggling to sleep because my mind is always busy, even when I am sleeping. I am actually sleeping longer but not well."

Client reports: Sleeping 7-8 hours (up from 5-6 before relocation) but waking exhausted. Vivid work-related dreams throughout the night — meetings, conversations, navigating the new city. Describes mind as "like the engine is always idling, even when the car is parked." Recently relocated internationally for work. Not anxious or stressed — reports being happier than in years, socially thriving, making friends.

Assessment: Unrefreshing sleep despite adequate duration, consistent with insufficient deep (N3) sleep. Client's tracker shows 21% combined Deep+REM (1h 27m out of ~7h) with 79% light sleep — note: tracker does not separate N3 from REM, so exact delta sleep percentage is unknown. The high volume of vivid, content-rich dreaming suggests cognitive processing is occurring at shallow sleep stages rather than deep restorative stages. Recent international relocation presents a significant novel-data load (new language, cultural norms, spatial navigation, social dynamics) that the subconscious is processing during sleep. Not anxiety-related — client is positive and relaxed during waking hours.

Prognosis: Good — client is motivated, shows strong hypnotic responsiveness (arm-raising induction: all 4 nods, visible hand levitation, hand-to-forehead challenge held, rapid reactional re-entry on all 4 cycles). 76% Physical suggestibility responds well to direct, literal therapeutic language.

SESSION METRICS (CLIENT-REPORTED BASELINE)

4/10	21%	79%	Bad
SLEEP QUALITY (SUBJECTIVE)	DEEP+REM COMBINED*	LIGHT SLEEP	TRACKER DEPTH SCORE

*Client's tracker combines Deep (N3) and REM into one category. Actual N3 delta percentage is unknown from this data. Tracker data is for client's personal reference — therapy outcomes are measured through subjective experience and clinical observation.

TECHNIQUES USED

Eagle arm-raise, trophy staircase, cellular regeneration progressive, island cabin, Sorting Room, Depth Dial, Settling Pond

POST-HYPNOTIC SUGGESTIONS (PENDING — INSTALLATION IN SESSION 2)

Session 1 was cognitive assessment + first induction experience. The post-hypnotic suggestions below are scheduled for installation in Session 2 (The Installation Session), where each will be systematically anchored in deep trance with ideomotor confirmation.

- 1. Sorting Room:** Subconscious processing team (Face Gallery, Language Wing, Map Room) files daily data silently during delta sleep
- 2. Depth Dial:** Surface (8 Hz) → Shallow → Medium → Deep → DELTA LOCK (0.5 Hz) — permanently installed, turns to DELTA LOCK every night
- 3. Delta Floor:** Brain bypasses light sleep directly to delta within 30 minutes. 3-hour uninterrupted deep sleep lock.
- 4. Settling Pond:** Day's impressions settle like gold dust in still water — gravity does the work
- 5. Island Cabin:** Permanent healing sanctuary — cedar, ocean air, weighted blanket, cellular regeneration
- 6. Pillow Trigger:** Head on pillow + 4-7-8 breathing = Depth Dial auto-turns to DELTA LOCK. 4 breaths to sleep.
- 7. Night-Waking Reset:** Hand on chest + one 4-7-8 breath = Depth Dial resets to DELTA LOCK. Back to delta in 60 seconds.
- 8. 10:30 PM Time Anchor:** Nervous system begins shutdown sequence automatically at 10:30 every night
- 9. Venting Dream Activation:** Vivid dreams = system clearing backlog. Remembering dreams = proof hypnosis is working.
- 10. Tracker as Convincer:** Each morning, rising deep sleep % reinforces the programming. Positive feedback loop.

TREATMENT PLAN

Sessions:	6-8 (6 core + 2 contingency, reassessed at session 4)
Frequency:	Every 1-2 weeks
Approach:	Clinical hypnotherapy, Physical suggestible lane (direct/literal), progress-driven with subjective + clinical measures
Session 1:	Assessment + Education + First Induction Experience
Session 2:	THE INSTALLATION — 10 post-hypnotic suggestions anchored in deep trance with ideomotor checks
Session 3:	Maintenance + Reinforcement (Depth Anchor Chain, Processing Vault, Auto-Pilot)
Session 4:	Independence Pivot — self-hypnosis taught, client runs ceremony alone

Sessions 5-6: Fine-tuning based on data / Graduation
Sessions 7-8: Contingency (only if data requires)

#	FOCUS	KEY TARGET	STATUS
1	Assessment + Installation	Baseline	Done
2	The Installation	10 PHS anchored	Upcoming
3	Maintenance + overactive mind	Night-waking ease	Upcoming
4	Self-hypnosis independence	Self-directed	Upcoming
5	Fine-tuning	Effortless onset	Upcoming
6	Graduation	All goals met	Upcoming

PROGRESS INDICATORS

HOW WE MEASURE	WHERE YOU STARTED	WHAT IMPROVEMENT LOOKS LIKE
How you feel waking up	4/10 (exhausted)	7-8/10 (refreshed, rested)
Falling asleep	Difficult (~35 min)	Natural, effortless
Night-waking	Frequent, hard to return	Rare, returns easily
Daytime energy	Low, persistent fatigue	Consistent throughout day
Ceremony compliance	Starting	Effortless habit
Self-hypnosis confidence	Not yet learned	8+/10 (fully independent)

Progress is measured through your subjective experience and clinical observation. If you use a personal sleep tracker, that data is for your own awareness — therapy outcomes are not determined by device readings.

CLIENT RESPONSIBILITIES

Treatment outcomes depend on daily home practice between sessions.

NIGHTLY SLEEP CEREMONY (10:30 PM)	FREQ	DONE
4-7-8 breathing	Daily	YES
Tension-release	Daily	--
Settling practice	Daily	--
Dream journal	Daily	--
Screen cutoff	Daily	--
Time-boxing	Daily	--
Session recording	Daily	--
Sleep tracking	Daily	--

- Attend all scheduled sessions (reschedule with 24-hour notice)
- Bring sleep tracker data to each session (weekly trends)
- Maintain consistent bedtime within 30-minute window (10:30 PM)
- No alcohol as sleep aid (disrupts deep sleep architecture)
- Report new symptoms, medication changes, or concerns promptly

CLIENT-REPORTED OUTCOMES

Post-session (Oct 2, 6:12 AM): 'After the session, I went to bed immediately. It took me awhile to fall asleep. But once fell asleep, I got up just once to use the bathroom. Sleep started at 11 pm and woke up at 7:33 am.' Reports losing 1 kg overnight (unsure if related). ECG showed resting heart rate dropped from usual 72 bpm to 63 bpm the morning after. Historical baseline was 57 bpm. Asks how many sessions the program requires — notes tendency to 'lose or get fatigue after 4-5 sessions.' Watch data to follow.

NEXT STEPS

Next Session: Session 2: Review watch/sleep data. Reinforce Depth Dial. Address the 'took awhile to fall asleep' — strengthen the pillow trigger and 4-7-8 anchor. The 8.5-hour sleep block (11 PM to 7:33 AM) with only 1 wake is a strong first-session result. Heart rate drop (72 to 63) suggests significant

parasympathetic activation — document as objective progress marker. Manage session fatigue concern — set expectations for 6-8 session arc, not open-ended.

Schedule at: calendly.com/jeeth-vrishihypno/90min

If sleep deteriorates significantly, you experience persistent anxiety, panic, or suicidal thoughts, or develop new physical symptoms — contact your primary care physician immediately.
